

DOUBLE K ELECTRONICS

AUTOMILKER

Up to 60% of milk quality reduction is due to dirty milk lines.

The most effective way to achieve clean lines is with the a fully automated wash system. The milking machine air injector wash system is easily fitted to any type of milk line, operates with low voltage, is farmer settable and easy to use.

Double K Electronics also makes a range of products which increases the quality of milk, encourage heatat condition, reduce the time spent milking and increase profits. Our core product, the Automilker automatically senses the flow of milk on a cow and removes the cup when milking is complete. The Automilker enables milking with less staff, maximizes yield and minimizes under and over milking. Our Automilker teat sprayer can be integrated with both hearing bone and rotary sheds with the ability to sense rotation and direction and empty bails on the later.

The low voltage is controlled AIR injector is easily adjusted .

You can keep the milk line and receiver can as clean as a gun barrel – without flooding the milk pump.

Our dealers can easily install this system over summer when the risk of grading increases due to milk line contamination in 60 to 100mm diameter lines.

The system comprises of a control box that runs two air injectors . The injectors can be controlled independently and are automatically varied to prevent flooding of the receiver can.

The system has been designed so that the farmer can adjust all the settings.
